

Internship Diary

Name: Adon Mathew Joseph

USN: 4JK22CS003

Company: VisionAstraa EV Academy

Designation: AI - ML FOR EV Intern

2 February 2026

Entry:

Internship Inauguration & Program Overview

Learnings:

On the first day of the internship, I attended the official inauguration session, which provided a comprehensive overview of the VisionAstraa EV Academy program. I gained a clear understanding of how the internship is structured over 16 weeks and how it focuses on bridging the gap between theoretical academic knowledge and practical industry requirements. The session emphasized the rapid growth of the electric vehicle (EV) industry and India's vision of becoming a global leader in EV manufacturing. I learned about the importance of industry-academia collaboration and how such programs help students become industry-ready engineers. The speakers introduced key technical domains such as Battery Management Systems (BMS), power electronics, EV architecture, and embedded systems. I also understood how artificial intelligence and data science are integrated into EV technology to improve efficiency, safety, and performance. Additionally, the session highlighted the importance of project-based learning, teamwork, and continuous skill development throughout the internship. Overall, this session helped me build a strong foundation and motivated me to actively participate and gain maximum knowledge from the internship.

Hours: 4 hours

Total: 4 hours

3 February 2026

Entry:

Introduction to AIML in EV Systems

Learnings:

On this day, I was introduced to the application of Artificial Intelligence and Machine Learning (AIML) in the electric vehicle domain. I learned how modern EVs generate large volumes of data through sensors, which can be analyzed using machine learning techniques to improve vehicle performance and reliability. The session explained key applications such as battery health monitoring, predictive maintenance, and range estimation. I understood how AI models can predict potential failures in EV components before they occur, thereby improving safety and reducing maintenance costs. The concept of real-time data processing was also introduced, highlighting how EV systems continuously monitor parameters like voltage, current, and temperature. Additionally, I learned about Advanced Driver Assistance Systems (ADAS) and how AI contributes to features like lane detection and obstacle recognition. The session also emphasized the importance of integrating software intelligence with hardware systems in EVs. This helped me understand the interdisciplinary nature of EV technology, combining data science, electronics, and mechanical systems. Overall, the session provided a strong introduction to how AI is transforming the automotive industry.

Hours: 4 hours

Total: 8 hours

4 February 2026

Entry:

Data Preprocessing & EV Data Handling

Learnings:

During this session, I learned about the importance of data preprocessing in machine learning, especially in the context of electric vehicle datasets. EV systems generate raw data from multiple sensors, but this data is often incomplete, noisy, or inconsistent. I understood the steps involved in cleaning such data, including handling missing values, removing duplicates, and correcting errors. The session also introduced techniques for data transformation, such as normalization and scaling, which are essential for improving the performance of machine learning models. I learned how to structure raw sensor data into a usable format suitable for analysis and model training. Additionally, the importance of maintaining data integrity was emphasized, as inaccurate data can lead to unreliable predictions in critical EV applications. The instructor also discussed different types of data formats and how to work with them efficiently using programming tools. This session helped me realize that data preprocessing is a crucial step in the machine learning pipeline, as it directly impacts the accuracy and reliability of the final model. Overall, I gained practical insights into preparing EV data for analysis.

Hours: 4 hours

Total: 12 hours

5 February 2026

Entry:

Exploratory Data Analysis (EDA)

Learnings:

On this day, I focused on Exploratory Data Analysis (EDA), which is an essential step in understanding datasets before applying machine learning models. I learned how to analyze EV-related data to identify patterns, trends, and relationships between variables such as battery voltage, temperature, and discharge rates. The session covered techniques for summarizing data using statistical measures like mean, median, and standard deviation. I also learned how to visualize data using graphs and charts, which helps in identifying outliers and anomalies. The importance of visual analysis was highlighted, as it allows engineers to quickly interpret complex datasets. In the context of EVs, I understood how EDA can be used to monitor battery performance and detect irregular behavior. The session also emphasized the importance of time-series analysis, as EV data is often collected over time. By analyzing trends, it becomes possible to predict future performance and identify potential issues. Overall, this session enhanced my ability to interpret and analyze data effectively, which is a critical skill in data science and EV engineering.

Hours: 4 hours

Total: 16 hours

6 February 2026

Entry:

In this session, I was introduced to fundamental machine learning models, including regression and classification techniques. I learned how regression models are used to predict continuous values, such as estimating battery charge levels or vehicle range. Classification models, on the other hand, are used to categorize data into different classes, such as identifying whether a battery is functioning normally or showing signs of failure. The session included practical examples of how these models can be applied to real-world EV problems. I understood the mathematical intuition behind these algorithms and how they learn patterns from data. The importance of training and testing datasets was also explained, highlighting how models are evaluated for accuracy. Additionally, I learned about the limitations of these models and the need for proper tuning to achieve better performance. This session helped me build a strong foundation in machine learning concepts and understand their practical applications in the EV industry.

Learnings:

Total: 20 hours

7 February 2026

Entry:

Model Evaluation & Optimization

Learnings:

On this day, I learned about evaluating and optimizing machine learning models to improve their performance. The session focused on different evaluation metrics such as accuracy, precision, recall, and error rates. I understood how these metrics help in determining the effectiveness of a model in real-world scenarios. The concept of overfitting and underfitting was also explained, showing how a model can either perform too specifically on training data or fail to generalize to new data. Techniques for improving model performance, such as parameter tuning and cross-validation, were discussed in detail. In the context of EVs, I learned how accurate models are essential for predicting battery health and ensuring vehicle safety. The session also highlighted the importance of balancing model complexity and computational efficiency, especially when deploying models in resource-constrained environments like EV systems. Overall, this session provided valuable insights into refining machine learning models for practical applications.

Total: 24 hours

8 February 2026

Entry:

Self-Learning

Learnings:

Just for learning

Hours: 4 hours

Total: 28 hours

9 February 2026

Entry:

Feature Engineering & Selection

Learnings:

On this day, I learned the importance of feature engineering and selection in machine learning. The session explained how raw EV data contains many variables, but not all of them contribute equally to model performance. I understood how to identify important features such as voltage, temperature, and current that directly affect battery performance. Techniques for reducing noise and improving model accuracy were also discussed. This helped me realize that selecting the right features simplifies models, reduces computation time, and enhances prediction reliability in EV systems

Hours: 4 hours

Total: 32 hours

10 February 2026

Entry:

Python Libraries for Data Science

Learnings:

This session focused on using Python libraries like NumPy and Pandas for handling EV datasets. I learned how to efficiently manipulate large volumes of sensor data, perform operations on arrays, and structure datasets into meaningful formats. The importance of data transformation for machine learning tasks was highlighted. I also understood how these libraries help in simplifying complex computations and preparing data for analysis. This session strengthened my coding skills and improved my ability to work with real-world EV data.

Hours: 4 hours

Total: 36 hours

11 February 2026

Entry:

Classification Algorithms

Learnings:

On this day, I learned about classification algorithms such as Logistic Regression and Decision Trees. These models are useful in identifying patterns and categorizing EV data, such as detecting battery faults or classifying driving behavior. I understood how probability-based predictions are made and how decision boundaries are formed. The importance of selecting appropriate models based on problem type was emphasized. This session helped me understand how classification techniques are applied in real-world EV safety and monitoring systems.

Hours: 4 hours

Total: 40 hours

12 February 2026

Entry:

Ensemble Learning Techniques

Learnings:

I was introduced to ensemble learning methods such as Random Forest, which combine multiple models to improve prediction accuracy. The session explained how using multiple decision trees can reduce errors and provide more stable results. I learned how ensemble models handle complex EV data more effectively than single models. This approach is especially useful in predicting battery performance under varying conditions. Overall, the session helped me understand how combining models leads to better and more reliable predictions

Hours: 4 hours

Total: 44 hours

13 February 2026

Entry:

Support Vector Machines & Model Validation

Learnings:

This session covered Support Vector Machines (SVM) and model validation techniques. I learned how SVM helps in classifying complex and high-dimensional EV data by creating optimal boundaries. The concept of kernel functions was introduced to handle non-linear data. Additionally, I understood validation methods like cross-validation, which ensure that models perform well on unseen data. This session emphasized building reliable and generalizable models for EV applications.

Hours: 4 hours

Total: 48 hours

14 February 2026

Entry:

Model Selection & Performance Tuning

Learnings:

On this day, I focused on selecting the best model and improving its performance. Techniques like hyperparameter tuning and grid search were explained. I learned how small changes in parameters can significantly impact model accuracy. The importance of avoiding overfitting and ensuring model generalization was highlighted. This session helped me understand how to fine-tune models for optimal performance in EV systems.

Hours: 4 hours

Total: 52 hours

15 February 2026

Entry:

Self-Learning

Learnings:

Just for learning

Hours: 4 hours

Total: 56 hours

16 February 2026

Entry:

Model Monitoring & Maintenance

Learnings:

I learned that machine learning models require continuous monitoring after deployment. The concept of data drift was introduced, where model accuracy decreases over time due to changes in data patterns. I understood how to maintain and retrain models to ensure long-term performance in EV systems. This session highlighted the importance of lifecycle management of AI models.

Hours: 4 hours

Total: 60 hours

17 February 2026

Entry:

Unsupervised Learning & Clustering

Learnings:

This session introduced unsupervised learning techniques such as K-Means clustering. I learned how to group similar EV data without predefined labels, such as identifying patterns in battery usage or driving behavior. This method helps in discovering hidden structures in data. It was useful to understand how clustering can improve energy management and anomaly detection in EV systems.

Hours: 4 hours

Total: 64 hours

18 February 2026

Entry:

Dimensionality Reduction (PCA)

Learnings:

I learned about dimensionality reduction using Principal Component Analysis (PCA). This technique helps in reducing the number of features while retaining important information. It improves model efficiency and reduces computational cost. In EV systems, this is useful for handling high-dimensional sensor data. This session enhanced my understanding of optimizing datasets for machine learning.

Hours: 4 hours

Total: 68 hours

19 February 2026

Entry:

Cloud Computing & Big Data in EV

Learnings:

This session focused on cloud computing and handling large-scale EV data. I learned how machine learning models can be deployed on cloud platforms to process data from multiple vehicles. The importance of real-time data analysis and scalability was emphasized. This helped me understand how EV companies manage large datasets efficiently.

Hours: 4 hours

Total: 72 hours

20 February 2026

Entry:

Model Optimization & Robust Testing

Learnings:

I learned techniques for optimizing machine learning models to run efficiently on EV hardware. The concept of model compression and pruning was explained. I also understood how to test models under extreme conditions to ensure reliability. This session highlighted the importance of balancing accuracy and computational efficiency.

Hours: 4 hours

Total: 76 hours

21 February 2026

Entry:

Practical Model Implementation

Learnings:

On this day, I focused on applying learned concepts to practical problems. I worked on implementing machine learning models using real EV datasets. This helped me understand the complete workflow from data preprocessing to model evaluation. It improved my confidence in handling real-world problems.

Hours: 4 hours

Total: 80 hours

22 February 2026

Entry:

Self-Learning

Learnings:

Just for learning

Hours: 4 hours

Total: 84 hours

23 February 2026

Entry:

Time-Series Forecasting

Learnings:

I learned about time-series analysis for predicting future EV performance. Techniques like ARIMA were introduced for forecasting battery life and usage patterns. This session helped me understand how historical data is used to make future predictions.

Hours: 4 hours

Total: 88 hours

24 February 2026

Entry:

RNN & LSTM Models

Learnings:

This session introduced deep learning models like RNN and LSTM for sequence data. I learned how these models remember past data and make accurate predictions. They are useful in EV applications like battery health prediction over time.

Hours: 4 hours

Total: 92 hours

25 February 2026

Entry:

Advanced Neural Networks (GRU, CNN)

Learnings:

I explored advanced neural networks like GRU and CNN for analyzing EV sensor data. These models help in identifying patterns and anomalies more effectively. The session emphasized improving model efficiency and accuracy.

Hours: 4 hours

Total: 96 hours

26 February 2026

Entry:

Hyperparameter Tuning

Learnings:

I learned how to optimize models using hyperparameter tuning techniques like Grid Search. This helps in achieving better accuracy and performance. The session emphasized the importance of fine-tuning models for real-world applications.

Hours: 4 hours

Total: 100 hours

27 February 2026

Entry:

Data Visualization & Storytelling

Learnings:

This session focused on presenting data insights using visualization tools. I learned how to create graphs and dashboards to communicate results effectively. This skill is important for explaining technical findings to non-technical stakeholders.

Hours: 4 hours

Total: 104 hours

28 February 2026

Entry:

Project Work & Integration

Learnings:

I worked on integrating all learned concepts into a project. This included data processing, model building, and evaluation. It helped me understand the complete lifecycle of a machine learning project in EV applications.

Hours: 4 hours

Total: 108 hours

1 March 2026

Entry:

Self-Learning

Learnings:

Just for learning

Hours: 4 hours

Total: 112 hours

2 March 2026

Entry:

Project Group Formation

Learnings:

On this day, I formed the project group and discussed initial ideas. I learned the importance of teamwork, coordination, and proper planning at the beginning stage of a project.

Hours: 4 hours

Total: 116 hours

3 March 2026

Entry:

Team Finalization

Learnings:

On this day, I finalized the team and assigned roles. I learned how proper role distribution improves efficiency and accountability in a project.

Hours: 4 hours

Total: 120 hours

4 March 2026

Entry:

Project Review

Learnings:

On this day, I reviewed different project ideas and evaluated their feasibility. I learned how to analyze projects based on complexity and practicality.

Hours: 4 hours

Total: 124 hours

5 March 2026

Entry:

Project Selection

Learnings:

On this day, I selected the project topic based on machine learning. I learned the importance of choosing a project with real-world relevance.

Hours: 4 hours

Total: 128 hours

6 March 2026

Entry:

Problem Definition

Learnings:

On this day, I defined the problem statement and objectives. I learned how clear problem definition helps in structured development.

Hours: 4 hours

Total: 132 hours

7 March 2026

Entry:

Research Initiation

Learnings:

On this day, I started research on existing systems and technologies. I learned how research helps in understanding gaps and improvements.

Hours: 4 hours

Total: 136 hours

8 March 2026

Entry:

Self-Learning

Learnings:

Just for learning

Hours: 4 hours

Total: 140 hours

9 March 2026

Entry:

Research Continuation

Learnings:

On this day, I continued research on datasets and algorithms. I learned how different models are used for prediction.

Hours: 4 hours

Total: 144 hours

10 March 2026

Entry:

Research Summary

Learnings:

On this day, I summarized research findings. I learned how to refine project direction based on collected information.

Hours: 4 hours

Total: 148 hours

11 March 2026

Entry:

Ideation Phase

Learnings:

On this day, I brainstormed different solution approaches. I learned how to select the best solution from multiple ideas.

Hours: 4 hours

Total: 152 hours

12 March 2026

Entry:

Feasibility Analysis

Learnings:

On this day, I analyzed project feasibility and risks. I learned how to evaluate project limitations.

Hours: 4 hours

Total: 156 hours

13 March 2026

Entry:

Project Planning

Learnings:

On this day, I created a project plan and milestones. I learned how planning improves workflow efficiency.

Hours: 4 hours

Total: 160 hours

14 March 2026

Entry:

Report Preparation

Learnings:

On this day, I prepared the initial project report. I learned structured documentation techniques.

Hours: 4 hours

Total: 164 hours

15 March 2026

Entry:

Self-Learning

Learnings:

Just for learning

Hours: 4 hours

Total: 168 hours

16 March 2026

Entry:

Report Finalization

Learnings:

On this day, I finalized and reviewed the report. I learned the importance of validation before submission.

Hours: 4 hours

Total: 172 hours

17 March 2026

Entry:

Dataset Collection

Learnings:

On this day, I collected the dataset. I learned the importance of quality data for machine learning.

Hours: 4 hours

Total: 176 hours

18 March 2026

Entry:

Data Preprocessing

Learnings:

On this day, I cleaned and prepared the dataset. I learned preprocessing techniques for better accuracy.

Hours: 4 hours

Total: 180 hours

19 March 2026

Entry:

Feature Selection

Learnings:

On this day, I selected important features. I learned how features impact model performance.

Hours: 4 hours

Total: 184 hours

20 March 2026

Entry:

Model Training

Learnings:

On this day, I trained the model. I learned how models learn from data patterns.

Hours: 4 hours

Total: 188 hours

21 March 2026

Entry:

Model Evaluation

Learnings:

On this day, I evaluated model performance. I learned about accuracy and confusion matrix.

Hours: 4 hours

Total: 192 hours

22 March 2026

Entry:

Self-Learning

Learnings:

Just for learning

Hours: 4 hours

Total: 196 hours

23 March 2026

Entry:

Model Optimization

Learnings:

On this day, I improved model performance. I learned parameter tuning techniques

Hours: 4 hours

Total: 200 hours

24 March 2026

Entry:

Flask Setup

Learnings:

On this day, I learned Flask basics. I understood backend development concepts

Hours: 4 hours

Total: 204 hours

25 March 2026

Entry:

Flask Application Development

Learnings:

On this day, I created a Flask app. I learned routing and request handling.

Hours: 4 hours

Total: 208 hours

26 March 2026

Entry:

Frontend Design

Learnings:

On this day, I designed UI using HTML and CSS. I learned user interaction basics.

Hours: 4 hours

Total: 212 hours

27 March 2026

Entry:

Model Integration

Learnings:

On this day, I integrated ML model with Flask. I learned system integration.

Hours: 4 hours

Total: 216 hours

28 March 2026

Entry:

Cloud Storage Solutions

Learnings:

Explored cloud storage solutions for managing large EV datasets.

Hours: 4 hours

Total: 220 hours

29 March 2026

Entry:

Self-Learning

Learnings:

Just for learning

Hours: 4 hours

Total: 224 hours

30 March 2026

Entry:

API Development

Learnings:

On this day, I implemented API communication. I learned request-response handling.

Hours: 4 hours

Total: 228 hours

31 March 2026

Entry:

Testing Phase

Learnings:

On this day, I tested the system. I learned bug detection and fixing.

Hours: 4 hours

Total: 232 hours

1 April 2026

Entry:

Debugging Errors

Learnings:

On this day, I fixed errors. I improved debugging skills.

Hours: 4 hours

Total: 236 hours

2 April 2026

Entry:

UI Improvement

Learnings:

On this day, I improved UI design. I learned usability principles.

Hours: 4 hours

Total: 240 hours

3 April 2026

Entry:

System Integration

Learnings:

On this day, I integrated frontend and backend. I learned complete system flow.

Hours: 4 hours

Total: 244 hours

4 April 2026

Entry:

Prediction Module Development

Learnings:

On this day, I developed prediction module. I learned real-time prediction flow.

Hours: 4 hours

Total: 248 hours

5 April 2026

Entry:

Self-Learning

Learnings:

Just for learning

Hours: 4 hours

Total: 252 hours

6 April 2026

Entry:

Testing and Debugging

Learnings:

On this day, I tested and debugged the system. I improved stability.

Hours: 4 hours

Total: 256 hours

7 April 2026

Entry:

UI Enhancement

Learnings:

On this day, I improved UI design. I learned user experience improvement.

Hours: 4 hours

Total: 260 hours

8 April 2026

Entry:

System Optimization

Learnings:

On this day, I optimized performance. I learned efficiency improvement.

Hours: 4 hours

Total: 264 hours

9 April 2026

Entry:

Documentation Work

Learnings:

On this day, I updated documentation. I learned structured writing.

Hours: 4 hours

Total: 268 hours

10 April 2026

Entry:

Review Preparation

Learnings:

On this day, I prepared review content. I learned presentation structuring.

Hours: 4 hours

Total: 272 hours

11 April 2026

Entry:

Feature Scaling Techniques

Learnings:

Learned about different feature scaling techniques and their impact on ML models.

Hours: 4 hours

Total: 276 hours

12 April 2026

Entry:

Self-Learning

Learnings:

Just for learning

Hours: 4 hours

Total: 280 hours

13 April 2026

Entry:

Final Review Preparation

Learnings:

On this day, I finalized presentation. I improved clarity and confidence.

Hours: 4 hours

Total: 284 hours

14 April 2026

Entry:

Project Progress & Review

Learnings:

On this day, I reviewed my project progress and identified areas for improvement. I learned the importance of continuous refinement and validation in machine learning projects. This session helped me consolidate my knowledge and prepare for upcoming tasks.

Hours: 4 hours

Total: 288 hours

15 April 2026

Entry:

Dataset Final Preparation

Learnings:

I worked on finalizing datasets used for training the EV prediction models. I learned how to clean large datasets, remove inconsistencies, and normalize values for better model accuracy. Special focus was given to EV battery and sensor datasets.

Hours: 4 hours

Total: 292 hours

16 April 2026

Entry:

Model Training Phase Begins

Learnings:

Started training machine learning models for battery health prediction and range estimation. Learned how training parameters affect model performance. Observed how models learn patterns from EV data.

Hours: 4 hours

Total: 296 hours

17 April 2026

Entry:

Model Accuracy Improvement

Learnings:

Focused on improving model accuracy by tuning parameters and adjusting datasets. Learned how small changes in data distribution impact predictions. Understood importance of balancing bias and variance.

Hours: 4 hours

Total: 300 hours

18 April 2026

Entry:

EV Battery Prediction System Testing

Learnings:

Tested battery health prediction model using real EV-like datasets. Learned how predictions vary under different conditions such as temperature and load changes.

Hours: 4 hours

Total: 304 hours

19 April 2026

Entry:

Self-Learning

Learnings:

Just for learning

Hours: 4 hours

Total: 308 hours

20 April 2026

Entry:

Anomaly Detection System Development

Learnings:

Learned how to detect abnormal behavior in EV battery and sensor data using ML models. Understood importance of early fault detection in EV safety systems.

Hours: 4 hours

Total: 312 hours

21 April 2026

Entry:

Real-Time Data Simulation

Learnings:

Worked on simulating real-time EV sensor data. Learned how streaming data affects model predictions. Understood concept of continuous data flow in EV systems.

Hours: 4 hours

Total: 316 hours

22 April 2026

Entry:

Model Optimization for Deployment

Learnings:

Learned how to optimize machine learning models for deployment in EV systems with limited hardware resources. Focused on reducing computation time.

Hours: 4 hours

Total: 320 hours

23 April 2026

Entry:

API Integration for Model Access

Learnings:

Learned how APIs are used to connect machine learning models with applications. Understood how EV systems fetch predictions in real time using API calls.

Hours: 4 hours

Total: 324 hours

24 April 2026

Entry:

Cloud Deployment Basics

Learnings:

Learned how EV AI models are deployed on cloud platforms for scalability. Understood cloud computing concepts like storage, compute, and deployment pipelines.

Hours: 4 hours

Total: 328 hours

25 April 2026

Entry:

Dashboard Development for EV Monitoring

Learnings:

Worked on creating dashboards to visualize EV battery and performance data. Learned how real-time dashboards help in monitoring system health.

Hours: 4 hours

Total: 332 hours

26 April 2026

Entry:

Self-Learning

Learnings:

Just for learning

Hours: 4 hours

Total: 336 hours

27 April 2026

Entry:

Model Validation Phase

Learnings:

Validated trained models using test datasets. Learned importance of accuracy checks, confusion matrix, and error analysis in EV systems.

Hours: 4 hours

Total: 340 hours

28 April 2026

Entry:

System Debugging & Improvements

Learnings:

Identified and fixed issues in prediction pipeline. Learned debugging techniques for ML systems and improving model stability.

Hours: 4 hours

Total: 344 hours

29 April 2026

Entry:

EV AI System Integration Testing

Learnings:

Tested complete integration of all modules. Learned how data preprocessing, model, and output systems work together in real-time.

Hours: 4 hours

Total: 348 hours

30 April 2026

Entry:

Final Feature Enhancements

Learnings:

Improved final project features including prediction accuracy and visualization outputs. Learned importance of UI clarity and system responsiveness.

Hours: 4 hours

Total: 352 hours

1 May 2026

Entry:

Final Testing Phase

Learnings:

Performed final testing of EV AI project. Verified model stability and accuracy under different conditions. Ensured system readiness for submission.

Hours: 4 hours

Total: 356 hours

2 May 2026

Entry:

Project Documentation Preparation

Learnings:

Prepared complete project documentation. Learned how to structure technical reports with clear explanations of system design and implementation.

Hours: 4 hours

Total: 360 hours

3 May 2026

Entry:

Self-Learning

Learnings:

Just for learning

Hours: 4 hours

Total: 364 hours
